

ONE PLUS ONE EQUALS ONE TIMES ONE

DANIEL SCHÄPPI

1. AUTONOMOUS CATEGORIES AND SEMIADDITIVITY

Let \mathcal{C} be an autonomous symmetric monoidal category with a zero object 0 . Assume that the coproduct $I + I$ of the unit object I with itself exists. Write $\iota_i: I \rightarrow I + I$ for the structure maps of this coproduct. For all objects $C \in \mathcal{C}$, the functors $C \otimes -: \mathcal{C} \rightarrow \mathcal{C}$ are left adjoint to $C^\vee \otimes -: \mathcal{C} \rightarrow \mathcal{C}$, so they preserve all colimits. In particular, the maps $C \otimes \iota_i: C \otimes I \rightarrow C \otimes (I + I)$ exhibit $C \otimes (I + I)$ as the coproduct of two copies of $C \otimes I \cong C$. Furthermore, we have

$$\mathcal{C}(C, (I + I)^\vee) \cong \mathcal{C}(C \otimes (I + I), I) \cong \mathcal{C}(C, I) \times \mathcal{C}(C, I)$$

which shows that $(I + I)^\vee$ is a product of I with itself. This shows in particular that \mathcal{C}^{op} is again a category satisfying all our assumptions. We fix a product $I \times I$ of I with itself, and we write $\pi_i: I \times I \rightarrow I$ for the projection maps. Let $p_i: I + I \rightarrow I$ and $q_i: I \rightarrow I \times I$ be the unique maps making the diagrams

$$\begin{array}{ccc} \begin{array}{ccc} I & & I \\ \downarrow \iota_1 & \searrow \text{id} & \\ I + I & \xrightarrow{p_1} & I \\ \uparrow \iota_2 & \nearrow 0 & \\ I & & I \end{array} & \begin{array}{ccc} I & & I \\ \downarrow \iota_1 & \searrow 0 & \\ I + I & \xrightarrow{p_2} & I \\ \uparrow \iota_2 & \nearrow \text{id} & \\ I & & I \end{array} & \begin{array}{ccc} & I & \\ \text{id} \nearrow & & \uparrow \pi_1 \\ I & \xrightarrow{q_1} & I \times I \\ 0 \searrow & & \downarrow \pi_2 \\ & I & \end{array} & \begin{array}{ccc} & I & \\ 0 \nearrow & & \uparrow \pi_1 \\ I & \xrightarrow{q_2} & I \times I \\ \text{id} \searrow & & \downarrow \pi_2 \\ & I & \end{array} \end{array}$$

commutative.

Proposition 1.1. *The object $(I + I, p_1, p_2)$ is a weak product of I with itself, i.e., given an object $C \in \mathcal{C}$ and maps $f_i: C \rightarrow I$, there exists a map $f: C \rightarrow I + I$ with $p_i f = f_i$ for $i = 1, 2$. Dually, the object $(I \times I, q_1, q_2)$ is a weak coproduct of I with itself.*

Before proving this, we show how to use this to prove that the canonical map $\varphi: I + I \rightarrow I \times I$ is an isomorphism. First note φ is the unique map with $\pi_i \circ \varphi = p_i$, and it is also the unique map with $\varphi \circ \iota_i = q_i$. From Proposition 1.1 it follows that the dotted morphisms l and r in the commutative diagrams

$$\begin{array}{ccc} & I & \\ \pi_1 \nearrow & & \nwarrow \pi_1 \\ I \times I & \xrightarrow{r} & I + I \xrightarrow{\varphi} I \times I \\ \pi_2 \searrow & & \nearrow \pi_2 \\ & I & \\ & \downarrow p_2 & \\ & I & \end{array} \quad \text{and} \quad \begin{array}{ccc} & I & \\ \iota_1 \nwarrow & & \swarrow \iota_1 \\ I + I & \xrightarrow{\varphi} & I \times I \xrightarrow{l} I + I \\ \iota_2 \swarrow & & \nwarrow \iota_2 \\ & I & \\ & \uparrow q_2 & \\ & I & \end{array}$$

exist. Commutativity immediately implies that $\varphi r = \text{id}$ and $l\varphi = \text{id}$, which shows that the canonical morphism $I + I \rightarrow I \times I$ is indeed an isomorphism.

Corollary 1.2. *Let \mathcal{C} be an autonomous symmetric monoidal category with a zero object 0 such that the coproduct $I + I$ of the unit object I with itself exists. Then \mathcal{C} is enriched in commutative monoids. If \mathcal{C} has all finite coproducts, then \mathcal{C} is semiadditive.*

Proof. The functors $C \otimes -$ are both left and right adjoint, hence the coproduct $C + C$ and the product $C \times C$ exist (they are the images of $I + I$ and $I \times I$ under $C \otimes -$). Moreover, it follows from the above considerations that $C + C \cong C \times C$, i.e., that the biproduct of C with itself exists. Using the diagonal and codiagonal maps one obtains the desired monoid structure on hom-sets. \square

Corollary 1.3. *Let \mathcal{V} be a cosmos (a complete and cocomplete symmetric monoidal closed category) with a zero object such that the object $I + I$ is dualizable. Then \mathcal{V} is semiadditive.*

Proof. Let $\mathcal{C} \subseteq \mathcal{V}$ be the full subcategory of dualizable objects. First note that the existence of internal homs implies that $V \otimes -$ will preserve colimits, so we have

$$\mathcal{V}(V, (I + I)^\vee) \cong \mathcal{V}(V \otimes (I + I), I) \cong \mathcal{V}(V, I) \times \mathcal{V}(V, I)$$

for any object $V \in \mathcal{V}$. This shows that $(I + I)^\vee$ is isomorphic to $I \times I$, i.e., that $I \times I$ lies in \mathcal{C} . Thus we can apply Corollary 1.2 to find that the canonical map $I + I \rightarrow I \times I$ is an isomorphism. Moreover, for any $M, N \in \mathcal{V}$ we have isomorphisms

$$\mathcal{V}(M, N \otimes (I \times I)) \cong \mathcal{V}(M \otimes (I + I), N) \cong \mathcal{V}(M, N) \times \mathcal{V}(M, N)$$

which are natural in M . This shows that $N \otimes (I \times I) \cong N \times N$, which implies that the canonical map $N + N \rightarrow N \times N$ is an isomorphism. It follows that \mathcal{V} is enriched in commutative monoids. \square

In order to prove Proposition 1.1 we need to introduce some auxiliary maps. We first fix an object $C \in \mathcal{C}$, together with two morphisms $f_i: C \rightarrow I$. Let

$$h: I \otimes (I + I) \rightarrow (I + I) \otimes (I + I) \quad \text{and} \quad k: C \otimes (I + I) \rightarrow I + I$$

be the unique maps which make the diagrams

$$\begin{array}{ccc} I \otimes I & & C \otimes I \xrightarrow{f_1 \otimes \iota_1} I \otimes (I + I) \\ I \otimes \iota_1 \downarrow & \searrow^{\iota_1 \otimes \iota_1} & \downarrow \cong \\ I \otimes (I + I) \xrightarrow{h} & (I + I) \otimes (I + I) & C \otimes (I + I) \xrightarrow{k} I + I \\ I \otimes \iota_2 \uparrow & \nearrow_{\iota_2 \otimes \iota_2} & \uparrow \cong \\ I \otimes I & & C \otimes I \xrightarrow{f_2 \otimes \iota_2} I \otimes (I + I) \end{array} \quad \text{and}$$

commutative.

Lemma 1.4. *The equality*

$$\begin{array}{c}
 C \\
 | \\
 \boxed{h} \\
 | \\
 \boxed{p_i \circ k} \\
 | \\
 I
 \end{array}
 \begin{array}{c}
 | \\
 I \\
 | \\
 I+I \\
 | \\
 I+I
 \end{array}
 =
 \begin{array}{c}
 C \\
 | \\
 \boxed{f_i} \\
 | \\
 I
 \end{array}
 \begin{array}{c}
 | \\
 I \\
 | \\
 \boxed{p_i} \\
 | \\
 I \\
 | \\
 \boxed{l_i} \\
 | \\
 I+I
 \end{array}$$

holds.

Proof. Since $C \otimes I \otimes -$ preserves coproducts, it suffices to check that both sides of the above equation coincide when precomposed with $C \otimes I \otimes \iota_i$ and $C \otimes I \otimes \iota_{3-i}$. It follows easily from the definitions that these composites are $(l_I \circ f_i \otimes I) \otimes \iota_i$ and 0 respectively, where $l_I: I \otimes I \rightarrow I$ is the canonical isomorphism. \square

Proof of Prop 1.1. We define a map $f: C \rightarrow I + I$ by the string diagram

$$f = \begin{array}{c}
 C \\
 | \\
 \bullet \\
 | \\
 \boxed{h} \\
 | \\
 \boxed{k} \\
 | \\
 I+I
 \end{array}
 \begin{array}{c}
 | \\
 I \\
 | \\
 I+I \\
 | \\
 I+I \\
 | \\
 I+I
 \end{array}
 \begin{array}{c}
 (I+I)^\vee \\
 | \\
 (I+I)^\vee \\
 | \\
 (I+I)^\vee
 \end{array}$$

Lemma 1.4 gives one of the equalities in the sequence

$$\begin{array}{c}
 C \\

 \boxed{f_i} \\
 | \\
 I
 \end{array}
 \begin{array}{c}
 | \\
 I \\
 | \\
 \boxed{p_i} \\
 | \\
 I \\
 | \\
 \boxed{l_i} \\
 | \\
 I+I
 \end{array}
 \begin{array}{c}
 (I+I)^\vee \\
 | \\
 (I+I)^\vee \\
 | \\
 (I+I)^\vee
 \end{array}$$

$$=
 \begin{array}{c}
 C \\
 | \\
 \boxed{f_i} \\
 | \\
 I
 \end{array}
 \begin{array}{c}
 | \\
 I+I \\
 | \\
 \boxed{p_i} \\
 | \\
 I \\
 | \\
 \boxed{l_i^\vee} \\
 | \\
 I^\vee
 \end{array}
 \begin{array}{c}
 (I+I)^\vee \\
 | \\
 (I+I)^\vee \\
 | \\
 (I+I)^\vee
 \end{array}
 =
 \begin{array}{c}
 C \\
 | \\
 \boxed{f_i} \\
 | \\
 I
 \end{array}
 \begin{array}{c}
 | \\
 I \\
 | \\
 \boxed{l_i} \\

 I^\vee \\
 | \\
 I^\vee
 \end{array}
 =
 \begin{array}{c}
 C \\
 | \\
 \boxed{f_i} \\
 | \\
 I
 \end{array}$$

which shows that $p_i \circ f = f_i$, as desired. This proves that $(I + I, p_1, p_2)$ is a weak product of I with itself. Moreover, we already showed that the product of I with

itself exists (it is isomorphic to the dual of $I + I$), so we can apply our reasoning to \mathcal{C}^{op} to find that $(I \times I, q_1, q_2)$ is a weak coproduct of I with itself. \square
